Cyrus 8 Vs2 Manual

Control most of the playback functions of your Cyrus streaming unit with a flick or tap of a finger on your phone or tablet. Company Registration Number 5158466 V.A.T Registration Number 844 4689 89. Hallmark of their design is easy upgrade path and high performance. Und so findet man in England zahlreiche, rein optisch unscheinbare High End Produkte, welche viele aufgemotzte Wattboliden im Stile W praktyce. Schweizer Kunden profitieren von einem befristeten Promotionsrabatt auf Cyrus Streamer. Offering a very very nice CYRUS 6 VS2. Perfect and AS NEW conditions, purchased from new has been out of the box and used a couple of times, maybe 10 hours of use in total. Comes with Box, Papers, Seals, Remote, everything in UNUSED UNMARKED AS NEW conditions. Very nice and good sounding British Amplifier, images talk more than 1000 words, so check them. Will ship with Express Courier with insurance, with dafe package. Detail and Specification from Cyrus Website6 vs2 Integrated Amplifier The new Cyrus Integrated 6 vs2 integrated amplifier is a wonderful place to enter the Cyrus range of products. It is the perfect match for the award winning CD 6s and when partnered by a set of good quality loudspeakers will provide outstanding musical performance from surprisingly compact components. Because the Cyrus Integrated 6vs2 is based on the Cyrus Integrated 8 vs2, it can be fully upgraded to the higher specification model. The new Cyrus Integrated 6 vs2 enjoys the same acoustic characteristic as the wider family of matching Cyrus components. Because we have engineered the range to be upgradeable and acoustically setup to match, you can upgrade from the Cyrus integrated 6 vs2 all the way up to the highest X series in affordable stages as funds and your enthusiasm allow. Our most affordable integrated amplifier boasts an impressive range of abilities.<http://challendor.com/fckeditor/upload/dual-xd7500-car-stereo-manual.xml>

- **cyrus 8 vs2 review, 1.0, cyrus 8 vs2 review.**

Amongst these is the uncanny skill to present a 3D audio picture of the recorded performance, along with surprisingly powerful dynamics for such a compact amplifier. The Cyrus Integrated 6 vs2 circuitry benefits from most of the development work of its larger sibling Cyrus Integrated 8 vs2. Although we have accomplished significant savings by installing a smaller power supply in the 6 vs2, the main boards are almost identical. Once our customers experience a system of this quality they often consider upgrading to the next level of performance and the Cyrus Integrated 6 vs2 can easily be upgraded to full Integrated 8vs2 specification by our factory. You simply return your Cyrus Integrated 6vs2 to our Huntingdon service facility where it is upgraded to full Cyrus Integrated 8 vs2 specification. The charge for this upgrade is only slightly more than the difference in price between the amps to cover labour and shipping. The amp includes our latest vs2 preamp topology. Quite a tough task when meeting the expected budget for a 40W amplifier. By scaling down the massive power supply of the Cyrus Integrated 8 vs2, this brief has been achieved in full with the Cyrus Integrated 6 vs2 inheriting the power amplifier and power supply design advances, the higher current output stage, the full complement of selected audiophile components, the soft standby switching and the advanced thermal management of the Cyrus Integrated 8 vs2. With these attributes the Cyrus Integrated 6 vs2 is able to deliver remarkable specifications for a 40W amplifier. The rated 30A peak current capability and 173W peak power into a 1 Ohm load would not shame an amplifier of double this capacity. In addition, the ambitious Cyrus Integrated 6 vs2 owner has the further benefit of an upgrade path through full Cyrus Integrated 8 vs2 specification and beyond, by opting for a Cyrus factory upgrade. Input sensitivity matching is also included.<http://www.haiyang.co.kr/uploaded/dual-xd7500-manual-pdf.xml>

Now appearing in our more affordable models is based on the work achieved with our acclaimed Virtual Servo preamp, we have further developed this interesting concept to now include the latest generation of digital volume IC's, hence vs2. Further refining our vs topology has brought very worthwhile advances over the previous model. These high efficiency techniques ensure maximum power transfer from the power supply to the speaker load. New peripheral circuitry for soft standby switching Electronic standby switching has always been a feature in Cyrus amplifiers. Electronic switching completely avoids the problems of contact degradation which occur in the speaker relays used in most other manufacturers designs. As these amplifiers age, the relay contacts degrade and contact nonlinearity gradually rises, degrading the sound. Secondary benefits are instantaneous disconnection of the power amplifier from the load if an external fault condition, such as a speaker shortcircuit, are detected by the control system. By the home page of Cyrus I dont find a download area. By companies such as Crest, Crown or QSC such download areas for PDF schematics and manuals is normal practice. I need it for realize interfaces for external separate power supply apart for power amp, pre amp so as the digital part. However, there are very good reasons why those diagrams are not published. The reasons are not really for secrecy as many might assume.

The diagrams are not published simply to try and prevent the wholesale destruction of these amplifiers by iffy technicians and DIY attempts. All, I know there are a few of you out there that could probably handle repairing one of these amplifiers. However, those few of you are both very advanced in knowledge and skill working with surface mount components and amplifier design. That leaves about 98% who can not hope to be successful in this. My own experiences repairing other peoples messes bears this out, and I have to agree that Cyrus made the correct decision when they decided not to publish or release these schematics. Most of you know I am normally on the other side of this argument. However, I also try to make sure people will be successful with these repairs. In this case, highly doubtful. Personally, I am bound by my agreement with Cyrus that prevents me from releasing any information that they have sent me. But, I will say one thing. Has anyone out there tried matching surface mount transistors. I have, and I do. Its a pain in the keester. Something that needs to be done in servicing to maintain proper operation. Just a glimpse into the world of proper amplifier servicing as it relates to one built using surface mount components. ChrisThis has its perils and things to watch for. Now for the really important part you should be prepared for. If you manage to remove the main PCB, you have created a problem assuming the previous repair was done right. You must do one of two things now. Either purchase the exact same insulators they are not cheap and completely clean the mounting area. If you are going to use any other type of transistor insulator, you must reduce the surface roughness of the mounting area to close to mirror smooth. This means starting with a course file and working down to a fine file to almost finish. This ensures a true surface and you must take your time. You will be tired after one side.

This is also how I actually do this, so Im not recommending anything that I dont actually do myself. Once the mounting area is both really smooth and clean, you may mount the outputs as you normally would using thermal compound not the stuff for computers!. If you are not prepared to do this, do not open it up. Hearing about someone working on one of these fills me with the same foreboding that hearing someone attempting to repair a Carver Cube M400 series does. Its a sad moment as most attempts result in an amplifier that is not repairable any more. ChrisThis is because I get the illusion after disassembly that it is a very simple design through the lot of surface mounted design

devices. I have repair two devices after performing of bad work though other technician. Would a service manual existed, this technician men didn't perform such repair try, because of the greater respect regarded to the actual much more effort of SMD devices than it seems after first look inside. Mr. Nelson Pass maintains such a download area. But I suspect a complete another reason why many small brands don't publish anything of documents and schematics. The creating of a good to understand service manual is very complicated and therefore there are in most cases only first handcraft drawings, in which this brands are ashamed to publish this. This has its perils and things to watch for. It's a sad moment as most attempts result in an amplifier that is not repairable any more. Chris Also by the older models I and II the surface roughness of the mounting surface are too large. But for a reliable prevention of electrical connections between the heatsink surface and the metal surface of the output power transistor through the insulating material this work must be always performed in any case. Here an example for a high quality insulators from This is because I get the illusion after disassembly that it is a very simple design through the lot of surface mounted design devices.

You will note that I am generally saying the same as you with respect to service information. The main problem is that pride gets in the way of intelligent thought with most technicians. I've spend 30 years or so, cleaning up after stupid people who I'd swear couldn't fix a battery switch light type circuit. With these Cyrus products, the circuit may look simple, but the elegance is lost on people who do not understand how it works. It's the same with most things. I have similar problems when people decide to repair a Carver product, or even Marantz amps. The elegance is totally lost on most people, and they therefore make inappropriate choices when servicing these. Now, when you add the fact that this is mostly surface mount, double sided with plated through holes, that should be enough to stop people from diving in without a clue. Most Cyrus products I get in after another shop or person has been in there has lifted and missing traces, and even torn out plating to the other side of the board. In short, a terrible mess. These issues are not caused by a lack of service information, it's caused by very poor workmanship. Sadly, this is also the norm for most service shops. Now, do you think for an instant these people are going to match their parts, or even buy them directly from proper distributors I can tell you the answer simply from observing what has happened in the past. It's a simple no. It's not in the manual, because you can see this with your eyes. The pro amps you pointed out are often in even worse condition. They even often are using the same insulators and thermal compound that was already there. This is of course a job that should never have left the shop, and yet here they are. The availability of service information will always encourage people to begin a repair they have no ability to complete. The opposite from what you are saying. How many pro BGW amps have I seen properly repaired None. Same goes for most other brands.

<http://harjac.com/images/canon-sensys-fax-l140-manual.pdf>

A repair includes properly adjusting bias and other things that may include protection limits, DC offset sometimes there is no control and even other currents or voltages like a Carver that are unique to one brand. Sometimes you have to change component values to make a required correction or adjustment, and this is the proper way to do this example BGW 750 series for DC offset, outlined in the manual. It's up to the servicing person to obtain the proper information, and some of it is expected as normal background info. In other words, things technicians are expected to know as part of their training. Some manufacturers did put out a manual of information common to everything, then never repeated it again. As a servicing technician, you can not assume anything. So this rule, coupled with learning from another, will keep everyone out of trouble. Mr. Nelson Pass maintains such a download area. Years ago I would agree without any reservations, but not now. I have seen how the quality of service people has declined over the years. It's actually very sad. No, download areas should exist. However, only certified technicians should be able to access to areas.

The problem as I see it is that as soon as you charge for your work, the person paying should be assured of your competence. Even if you don't charge anything. For instance, it is possible to create a shock hazard, even if you didn't intend to do that. I've had to clean up many situations like this too! The general quality of service manuals has also declined drastically over the years. Adjustment procedures have been verbal only!! A very poor business model if you ask me. The other reason are those companies who believe their product is special and advanced, so it's a secret. Most of these are really common circuits with nothing special about them. John Curls Blowtorch is a great example of this. The circuit is really basic, nothing to write home about.

But, the magic is in how parts are matched and the actual construction is done. This is commonly shown when servicing a classic guitar amplifier, an easy way to observe these effects. There is far more to servicing than a schematic. Really good technicians are worth far more than what the industry actually pays or consumers can understand. People starting out have the least respect for how much a good technician actually knows. It shows in their work. Chris That is the nature of die casting heatsink surface By eliminating a machining step, the costs were controlled. If each mounting surface were to be machined, the overall cost would be much higher for the product. However, this means a technician must be aware that either the surfaces are brought to normal roughness, or the same thermal pads are used. No problem, but I'd prefer smooth heat sinks as I've said. I mean, they certainly could finish these areas, but the cost would be increased a lot. Have you checked the cost of machining lately. Never forget, they still have to sell these. Perfect but not selling and out of business doesn't make a whole lot of sense. You can pick at almost any product that exists. At least they designed their stuff extremely well. The pads Cyrus uses actually flows the first time it gets warm and provides excellent heat transfer. Once formed, no problem. Now, if you wish to use a different material for thermal insulators, you'll have to smooth the surfaces. I believe I have been very clear and forthcoming on this. I wish I had a machine that would resurface these castings. But, I don't. I therefore haul out the files and do the job by hand. I wish they were done, but I can see why they aren't. They had a problem in design. They solved it. What more can you ask. It's not like they shipped defective products that fail. In fact, the failure rate is really extremely low on this product line, save the run of defective transistors. Even then, they did not fail for years after the warranty was up.

Chris This must be the follow 9 versions similar outfit than series III IIIi improved III 5 6 6vs 6vs2 6VSII 7 8 8vs and 8vs2 Who have make this of his own device I have stated that this equipment is all surface mount, save drivers, bias and output transistors. The component placement is very tight on top of that. I can not agree with the claim that available service information reduces repair attempts. All my own observations run counter to this, no matter what the brand name on the case. Any service technician who attempts a repair on an item that the service manual is not available for or even the schematic, and is complicated, is fighting a losing battle. Even if the unit operates when the work is done, it will probably not be adjusted correctly. I also know that the factory doesn't overcharge for their work. Yes, I do understand that there is some pride involved here. There is also the issue of being told you can't do something that rubs people the wrong way. I have been on both sides of this issue many times, so I know what you are feeling here. I would not trust the iii schematic either. Every single time a manufacturer has released service information for unique products, there has been mass carnage in the field. Then the service depots are overrun with angry customers and hacked units. The most common issue I've seen are destroyed PCBs. In other words, not worth repair. The owners do not like to hear things like that. It's also amazing how many attempt to hide the fact that someone else worked on it. Like we can't tell. They will deny this sometimes, even after being shown the evidence. A certain percentage of these people will accuse the service center of damaging the equipment, anything they can do so they aren't stuck with the bill. I'm not saying you are a bad technician at all. What I am saying is that opening the floodgates to the sea of hackers out there is disastrous. This is an unfortunate fact that created the situation as it is today.

So, you are looking for the entire library. What are you trying to figure out. I can tell you right now that they will not release the diagrams or manuals. Sorry about that. ChrisBut if there is clearly described, how difficult work it is repair performing by SMT, then the threshold to do a selfrepair it would be very large at least by the greatest number of technician guys. I need the complete schematic in the moment for the Cyrus 5 Cyrus V. I want to create a external power supply much more better than this one from Cyrus itself. The appropriate resistor replaces in the voltage amplifier output stage for the new conditions is a problem, because I have the possibility of CAD simulation. But a wide range of PCB wires I must cut to create the appropriate interface and without schematic it is much more difficult than with the concerning schematic. Also very helpful is the schematic printing of the PCB, both solder side and component side. Such work I have performed several times by other amps and I know the amount of the increase by sonic quality in all respects. Therefore I would prefer my own idea, because I have more choice in determining the quality standards especially concerning the transformers and capacitors.
